Large investments in the real estate and tourism sector, as well as rising numbers of tourists, immigrants, and investors have led to a sustained economic boom in Dubai and Las Vegas. At the same time, against the backdrop of urban governance and the transfer of duties and tasks to private and semi-state actors in both metropolises, a brisk urban transformation has been embarked upon, with the creation of countless entertainment, shopping, and artificial worlds. This development is characterized by the theming of every-day life, and above all by an "Economy of Fascination". The urban landscapes simulating various scenes from Ancient Rome to modern New York, artificial islands in the shapes of palm trees or whole world maps, as well as other superlatives in the form of themed shopping malls and sports arenas, are the most visible results of these rapid changes. The author develops guidelines for a research perspective called the "Economy of Fascination" and presents case studies of Dubai and Las Vegas to exemplify the approach. An analytical understanding first builds on general trends and lines of development against the backdrop of urban governance, an experience orientation, and commercialization. They form the starting point for an analysis of the mechanisms of "attention" and "fascination", which are considered to be the main aspects of an "Economy of Fascination".
Urbanization of the Earth (ISSN: 0944-422X) – Urban geography is a lively and almost unlimited field of research. Supported by its neighboring disciplines such as demography, sociology, economics and technologies of construction, traffic management and communications, it seeks to recognize trends and principles, and with regard to the future, to facilitate structured action. Entitled "Urbanization of the Earth", this series provides a platform for critically investigating a crucial junction in the relationships between man and the Earth. Humans as individuals or society as a whole, have proved to be a powerful force for shaping the surface of the Earth, almost equalling natural phenomena. Many more urban phenomena await study and analysis – providing a great deal of insight on the lively interface between humans and their environment.
